CHAPTER 1:

INTRODUCTION

Big Data

3

- Widespread use of personal computers and wireless communication leads to “big data”
- We are both producers and consumers of data
- Data is not random, it has structure, e.g., customer behavior
- We need “big theory” to extract that structure from data for
 - (a) Understanding the process
 - (b) Making predictions for the future

Why “Learn” ?

4

- Machine learning is programming computers to optimize a performance criterion using example data or past experience.
- There is no need to “learn” to calculate payroll
- Learning is used when:
 - ▣ Human expertise does not exist (navigating on Mars),
 - ▣ Humans are unable to explain their expertise (speech recognition)
 - ▣ Solution changes in time (routing on a computer network)
 - ▣ Solution needs to be adapted to particular cases (user biometrics)

What We Talk About When We Talk About “Learning”

5

- Learning general models from a data of particular examples
- Data is cheap and abundant (data warehouses, data marts); knowledge is expensive and scarce.
- Example in retail: Customer transactions to consumer behavior:

*People who bought “Blink” also bought “Outliers”
(www.amazon.com)*

- Build a model that is *a good and useful approximation* to the data.

Data Mining

6

- Retail: Market basket analysis, Customer relationship management (CRM)
- Finance: Credit scoring, fraud detection
- Manufacturing: Control, robotics, troubleshooting
- Medicine: Medical diagnosis
- Telecommunications: Spam filters, intrusion detection
- Bioinformatics: Motifs, alignment
- Web mining: Search engines
- ...

What is Machine Learning?

7

- Optimize a performance criterion using example data or past experience.
- Role of Statistics: Inference from a sample
- Role of Computer science: Efficient algorithms to
 - ▣ Solve the optimization problem
 - ▣ Representing and evaluating the model for inference

Applications

8

- Association

- Supervised Learning

 - Classification

 - Regression

- Unsupervised Learning

→ clustering

- Reinforcement Learning

Learning Associations

9

□ Basket analysis:

$P(Y | X)$ probability that somebody who buys X also buys Y where X and Y are products/services.

Example: $P(\text{chips} | \text{beer}) = 0.7$

Classification

10

- Example: Credit scoring
- Differentiating between **low-risk** and **high-risk** customers from their *income* and *savings*

Discriminant: IF $\text{income} > \theta_1$ AND $\text{savings} > \theta_2$
THEN **low-risk** ELSE **high-risk**

Classification: Applications

11

- Aka Pattern recognition
- Face recognition: Pose, lighting, occlusion (glasses, beard), make-up, hair style
- Character recognition: Different handwriting styles.
- Speech recognition: Temporal dependency.
- Medical diagnosis: From symptoms to illnesses
- Biometrics: Recognition/authentication using physical and/or behavioral characteristics: Face, iris, signature, etc
- Outlier/novelty detection:

Face Recognition

12

Training examples of a person

Test images

ORL dataset,
AT&T Laboratories, Cambridge UK

Regression

- Example: Price of a used car

- x : car attributes

y : price

$$y = g(x \mid \theta)$$

$g(\cdot)$ model,

θ parameters

Regression Applications

14

- Navigating a car: Angle of the steering
- Kinematics of a robot arm

■ Response surface design

Supervised Learning: Uses → prediction

15

- Prediction of future cases: Use the rule to predict the output for future inputs
- Knowledge extraction: The rule is easy to understand
- Compression: The rule is simpler than the data it explains
- Outlier detection: Exceptions that are not covered by the rule, e.g., fraud

Regression

Classification

Unsupervised Learning → clustering

16

- Learning “what normally happens”
- No output
- Clustering: Grouping similar instances
- Example applications
 - ▣ Customer segmentation in CRM
 - ▣ Image compression: Color quantization
 - ▣ Bioinformatics: Learning motifs

Reinforcement Learning

17

- Learning a policy: A **sequence** of outputs
- No supervised output but delayed reward
- Credit assignment problem
- Game playing
- Robot in a maze
- Multiple agents, partial observability, ...

Resources: Datasets
